

Reading age position statement

PIF guidance on a reading age for health information.

PIF guidance is to aim for a reading age of 9-11 in health information. This statement sets out our position and highlights useful tools.

Skill levels and the health literacy challenge

- Half of UK adults struggle to access trusted health information¹.
- Half of adults in England have literacy skills at or below primary school leaver levels².
- Health literacy can lower in stressful situations.
- Most people cannot remember basic NHS advice³.
- Half of adults have difficulty judging the advantages and disadvantages of treatments³.

Low health literacy is linked to:

- Poor general health.
- Increased hospital admissions.
- Low use of preventative services.
- Reduced life expectancy⁴.

Survey results

A 2022 survey of PIF members found more than 9 in 10 supported our reading age guidance.

Identified benefits included:

- Making information as accessible as possible.
- Providing consistency for the team.
- Providing guidance to external writers.
- Providing guidance for medical reviewers.

Readability tools

More than half of respondents to the survey were using a readability tool. Benefits included:

- Sense checking and improving work.
- Highlighting complex words.
- Consistency.
- Providing feedback or challenge to reviewers.

The [Hemingway Editor](#) was the most popular tool. Since the survey an [NHS Medical Document Readability tool](#) has also launched.

Limitations

Readability tools can be useful. They can help you spot long sentences, passive voice and jargon. However, they cannot tell you if text is appropriate, usable or logical.

You should always carry out extra checks on your text. This includes working with users to address health literacy issues and cultural sensitivities.

PIF's position

PIF advocates for the principle of universal precaution to ensure access to appropriate health information for all. A reading age of 9-11 supports this goal.
